

Hi,

6 October 2026

Here is my restaurant plan on one page: what I need, what it costs, and how many guests I need to break even. All figures are my own estimates, in rupees.

## The idea

A small 30-seat kitchen in Betalbatim, South Goa: momos, thukpa, wok dishes and a few Korean dishes. Food only, no bar. I found no other Korean place within 6 km of the spot, and the momo stalls nearby sell 7 pieces for about ₹100, so I will compete on quality, not on price.

## What I need (one time, ₹ lakh)

|                              |           |
|------------------------------|-----------|
| Rent deposit (3 months)      | 1.20      |
| Interiors and furniture      | 3.75      |
| Kitchen equipment            | 2.20      |
| Licences and signboard       | 0.40      |
| Billing app, menus, launch   | 0.60      |
| Plates, cutlery, first stock | 1.00      |
| Set-up total                 | 9.15 lakh |
| My backup cash (see below)   | 3.35 lakh |

Total I need: **₹12.5 lakh**

A 30-seat room costs more to fit out than a 24-seat one: more furniture and plates.

## My backup

₹3.35 lakh kept aside, about 3 months of fixed costs. June to August is slow in Goa, and I expect only a small loss then, about ₹7,000 a month. If only half the guests I plan for turn up, I would still end the year slightly ahead (about ₹0.7 lakh), though my worst months would lose around ₹59,000 each. The backup can cover that.

## What I expect (my best guess)

| Season                                     | Guests a day | Profit a month |
|--------------------------------------------|--------------|----------------|
| Busy: November to March                    | 30           | + ₹2.26 lakh   |
| In between: April, May, September, October | 18           | + ₹91,000      |
| Rainy: June to August                      | 10           | - ₹7,000       |

Over a year that is about ₹14.7 lakh if everything goes to plan. I am planning on about ₹9.85 lakh, after cutting a third for a slow start.

Guests a day assume the 30-seat room fills at the same rate I expected for 24 seats. Not counted: my own pay, income tax, and replacing equipment later. Wages, interiors and utilities are estimates until I have real quotes.

## What it costs every month

|                               |          |
|-------------------------------|----------|
| Rent                          | 40,000   |
| 3 staff: chef, helper, server | 50,000   |
| Gas, power, water, internet   | 13,000   |
| Repairs, licences, marketing  | 8,000    |
| Fixed total                   | 1,11,000 |

On top of that, ingredients are about 30% of each sale (35% in the rainy months) and card fees about 2%. So out of every ₹100 sold, about ₹68 is left to pay the monthly costs.

## Break-even

I need about **₹1.63 lakh** of sales a month, which is about **10 guests a day** at ₹550 each, only a third of the 30 seats. In the rainy months it is about 11 guests (₹1.76 lakh). Below that I lose money, above it I earn.

## Payback

|                     |                        |
|---------------------|------------------------|
| If all goes to plan | about 10 months        |
| My planning case    | <b>about 15 months</b> |

Time until the whole ₹12.5 lakh comes back as profit: ₹14.7 lakh a year if all goes to plan, ₹9.85 lakh a year in my planning case. Average months, before my own pay and tax; the real date depends on the season I open in.
